# EXTENSIVE APPLICATION OPTIMISED CLAMPING CHUCK PROGRAMME

**1 Direct clamping**  
with narrow contour from  $\varnothing$  3mm

**2 Extra short design**  
with BT or BT with face surface

**3 With optimised interference contour**  
for the highest rigidity in mould and die construction  
with 226 mm length

**4 HSK-E**  
with adjusted interference contour in short design

**5 Minimal interference contour**  
for special contour critical machining processes in  
long design

**6 Thermal shrinking chuck**  
with optimal contour and adjusted length for mould  
and die construction

**7 Slim thermal shrinking chuck**  
with narrow contour

**8 Miniature hydraulic clamping chuck**  
with HSK-25

**9 Hydraulic clamping chuck**  
with additional decentralised coolant outlets

# APPLICATION ORIENTATED FORMAT

---

## HSK-25

Hydraulic clamping chuck with miniature connection to reduce non-productive time

## HSK-32

Customer specific MQL solutions for small connections

## HSK-40

HSK-E for high rotational speed machining

## HSK-50

Clamping activation through the HSK flange

## HSK-63

Long, cylindrical construction for machining processes in limited spaces

---

## HSK-80

With enlarged face surface for higher bending resistance

---

## HSK-100

Short and heavy to long and slim designs possible

---

## BT-30

Connections for every spindle type

---

## SK-40

Greatest geometric design freedom through additive manufacturing

---

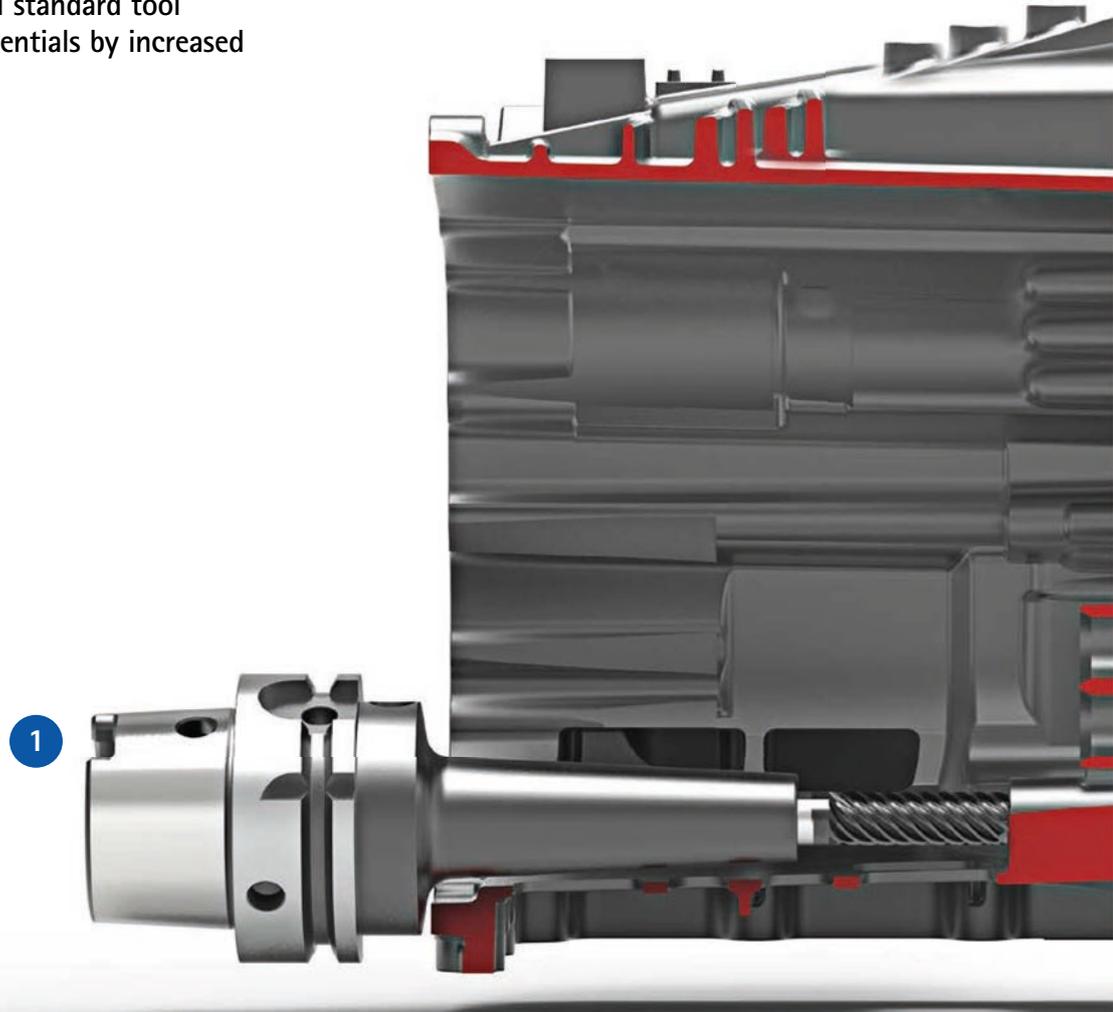

## SK-50

Hydraulic clamping chuck with  $A \geq 400$  possible

# HIGH COST SAVING POTENTIAL

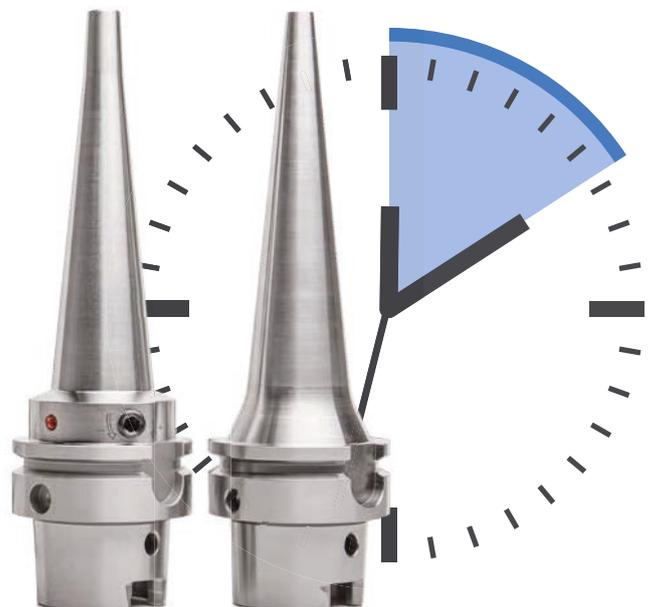

The ideal combination of application optimised hydraulic clamping chuck and standard tool achieves high cost saving potentials by increased performance and tool life.

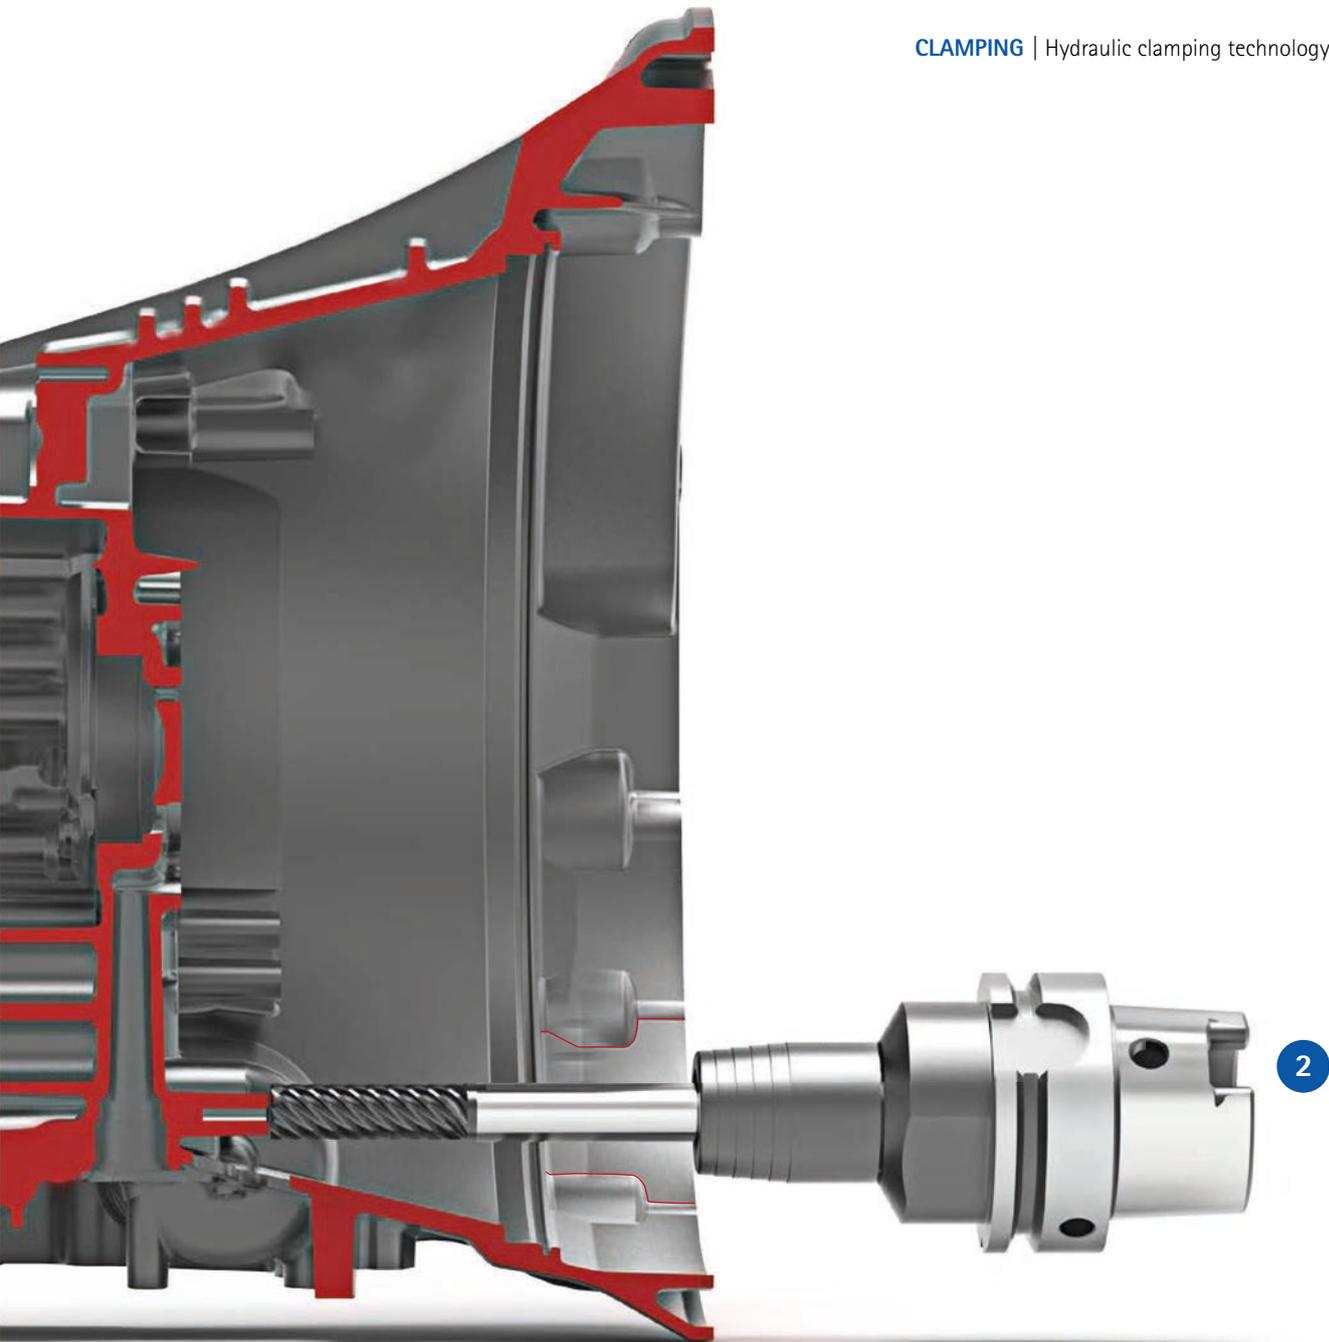

## Reducing non-productive times through changing to hydraulic clamping technology

Not only the achievable improvement in surface finish, but also the significantly simplified handling speaks for the change from thermal shrinking chucks to a HighTorque Chuck HTC with narrow contour. Here only a simple Allen key and the predefined number of rotations are required to clamp and release the tool, resulting in significantly quicker and simpler tool changes.

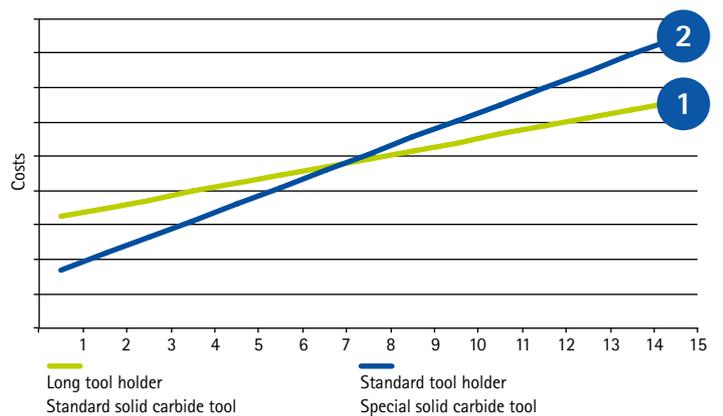

Number of tools in use	Tool changes per day	Time saved in minutes
10	3	120
20	3	240
50	3	600
10	5	200
20	5	400
50	5	1,000
100	5	2,000

### Amortisation calculation: Long hydraulic chuck and standard solid carbide tool

An example calculation shows that the higher acquisition costs of an application optimised chuck in combination with a standard tool opposed to the use of a standard chuck using a special solid carbide tool is redeemed after just eight tool changes.

# ADDITIVE MANUFACTURING PUSHES THE BOUNDARIES OF HYDRAULIC CLAMPING TECHNOLOGY

Accuracy, process reliability, flexibility and simple handling are the key requirements on a clamping chuck. From the systems available the hydraulic clamping chucks contribute the most when it comes to accuracy. However, the brazed connection of hydraulic chucks previously caused limitations in the area of temperature resistance and torque transfer. Additive manufacturing pushes the boundaries, in that, the chucks are produced in "one piece", allowing the hydraulic clamping technology to be used in a much broader range of applications.

# THE ADVANTAGES OF ADDITIVELY MANUFACTURED HYDRAULIC CLAMPING TECHNOLOGY IN DETAIL

Optimal run-out, as the clamping area is positioned in the area of the chuck tip

High torque transfer and temperature resistance

Back taper of 3° on the outer contour allows machining to be carried out in contour critical areas

All from one mould – no brazed connection between bush and body

High bending resistance, despite the slim design

Simple and quick clamping thanks to the hexagonal screw

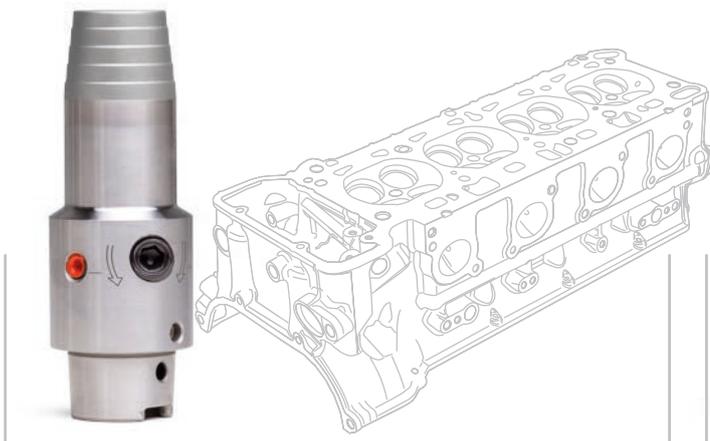

Additively manufactured hydraulic clamping technology with the least interference contour for a wide range of applications

## ADVANTAGES

- Wide spectrum of applications, amongst others, in mould and die construction, automobile and aerospace industries
- Machining in contour critical areas
- Process reliable clamping even with temperatures of up to 170 °C thanks to the elimination of the brazed connection between the bush and the body
- Optimal run-out accuracy of 3 µm by a projection length of 2.5 x D
- Improved surface finish values with longer tool life
- Shorter set-up times and lower tool costs
- No peripheral devices required

## PERFORMANCE CHARACTERISTICS

- Narrow contour with a back taper of 3°
- High torque transfer and bending resistance
- Simple and quick clamping directly in the machine
- Balancing value  $G=2.5$  at  $25,000 \text{ min}^{-1}$
- $\varnothing$ -range 3–32 mm
- Available with HSK and SK connections
- RFID option possible

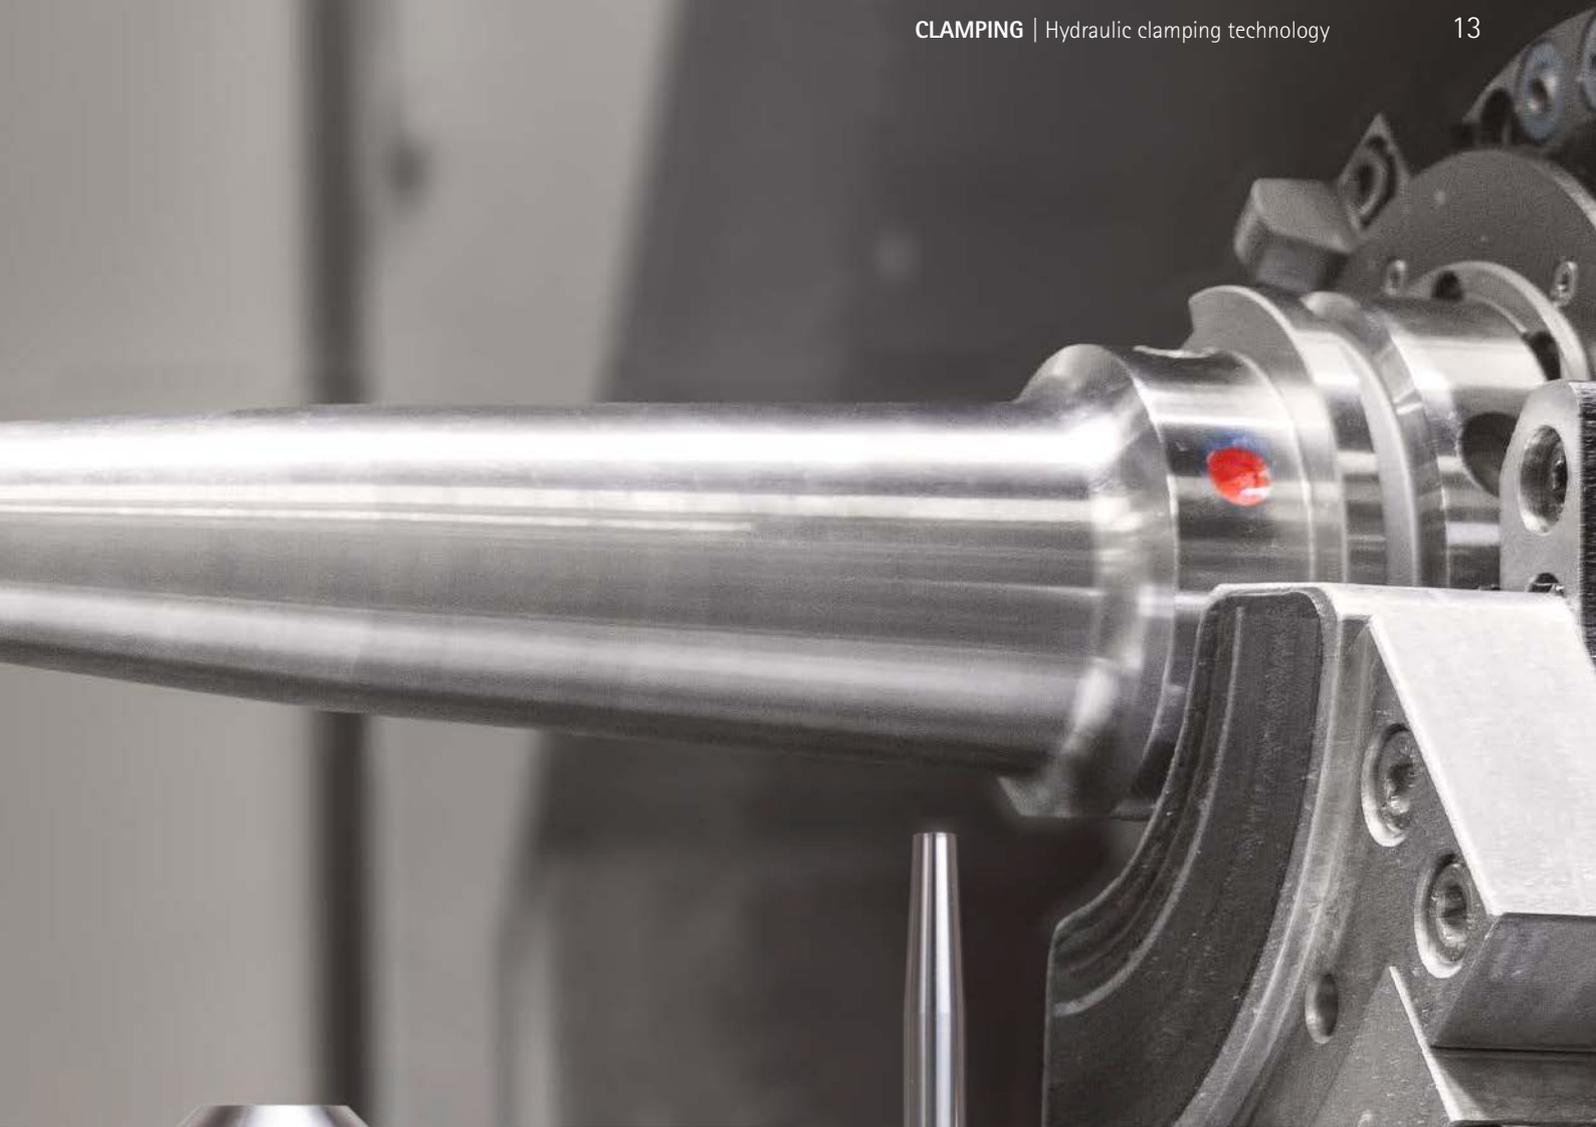

## 1 Machining of an injector bore

Due to the conversion from collet chucks to hydraulic clamping chucks with decentral coolant supply, the surface finish quality is improved and the non-productive time reduced. The improved coolant supply and better radial run-out of the hydraulic chuck result in an improvement of the bore quality with increased process reliability and tool life.

## 2 Machining of a valve body

The conversion to a compact hydraulic clamping chuck with integrated radial length adjustment in the flange allows the exact length adjustment and the compensation of length changes caused by the reconditioning of PCD tools, to be carried out on the high-productivity machine.

### 3 Heavy duty machining – milling process of wheel suspension

Conversion to additively manufactured hydraulic clamping chucks allows the highest load capacity through the elimination of the weak point on the brazed connection of the hydraulic bush. The highest operating temperature by maximum bending resistance and torque transfer assure the highest process reliability.

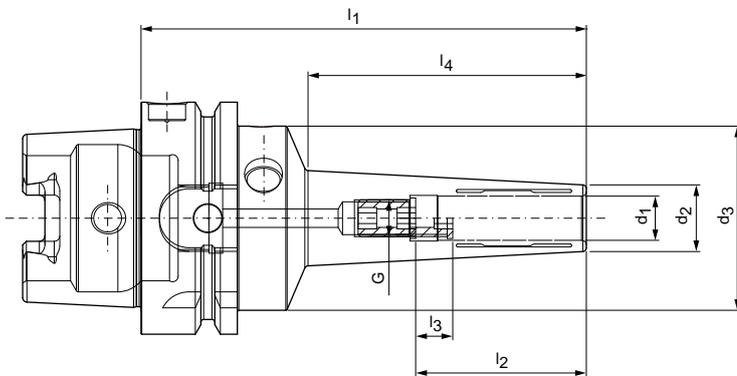

### 4 Drilling of stack materials with minimal interference contour

The conversion from standard shrinking chuck with extra-long special drill to long, additively manufactured hydraulic clamping chucks with standard length drill improves the bore quality with simpler handling and a considerable extension of the chuck life.

Dimensions in mm.

Use: For clamping tools with smooth cylindrical shanks in accordance with DIN 1835 Form A, DIN 6535 Form HA up to clamping diameter  $d_1 = 20$  mm as well as with recesses in accordance with DIN 1835 Form B, E and DIN 6535 Form HB, HE directly and without reducing sleeve in the clamping diameter. The clamping diameter is designed for a shank tolerance of h6.

Items included: With length adjustment screw, without coolant tube.

Design: Longest tool lives and highest manufacturing quality on usage of smooth cylindrical shanks in accordance with DIN 1835 Form A and DIN 6535 Form HA.

With a projection length of  $2.5 \times D$  (max. 50 mm) radial run-out accuracy  $3 \mu\text{m}$ .

On usage of cylindrical shanks with angled clamping surface (Form E and Form HE) the accuracy may be affected.

Note: Chuck with axial tool length adjustment. Coolant supply via central through bore.

Chip version: RFID code carrier on request.

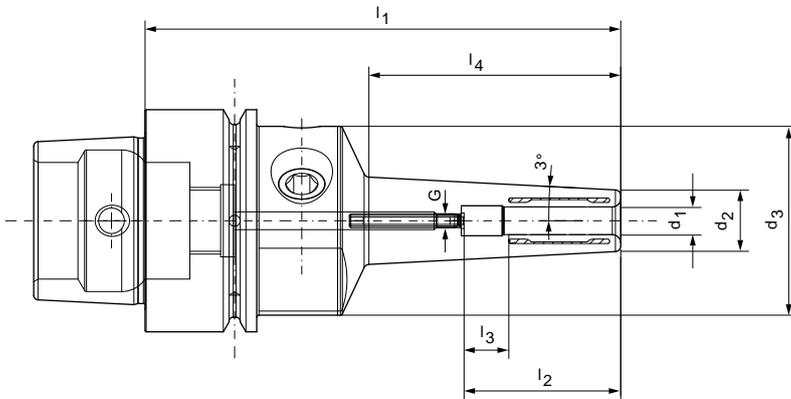

Further code carriers on request.

Balancing value: G 2.5 at  $25,000 \text{ min}^{-1}$  as delivered.

\* Design: Steep taper sizes are not available in combination AD/AF

Dimensions in mm.

Use: For clamping tools with smooth cylindrical shanks in accordance with DIN 1835 Form A, DIN 6535 Form HA up to clamping diameter  $d_1 = 32$  mm as well as with recesses in accordance with DIN 1835 Form B, E and DIN 6535 Form HB, HE directly and without reducing sleeve in the clamping diameter. The clamping diameter is designed for a shank tolerance of h6.

Items included: With length adjustment screws. Without pull stud.

Design: Normal setting Form AD, if Form AF is required, please state with the order.

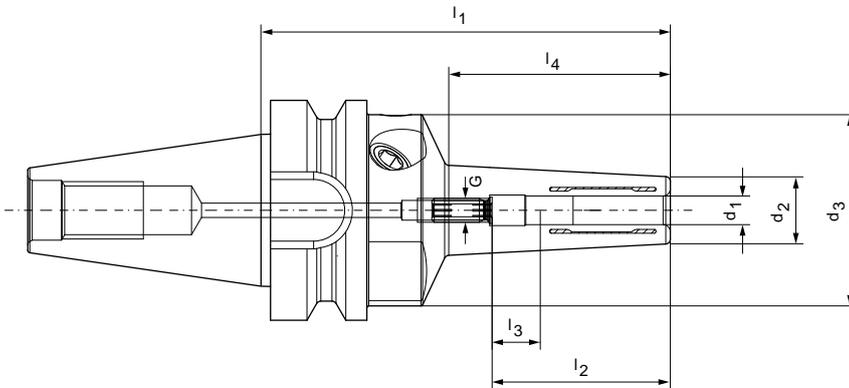

Note: Chuck with axial tool length adjustment.

Balancing value: G 2.5 at 25,000 min<sup>-1</sup> as delivered.

# HighTorque Chuck HTC

with axial tool length adjustment

Shank BT as per ISO 7388-2 Form JD/JS (JIS B 6339)

Dimensions in mm.

Use: For clamping tools with smooth cylindrical shanks in accordance with DIN 1835 Form A, DIN 6535 Form HA up to clamping diameter  $d_1 = 12$  mm as well as with recesses in accordance with DIN 1835 Form B, E and DIN 6535 Form HB, HE directly and without reducing sleeve in the clamping diameter. The clamping diameter is designed for a shank tolerance of h6.

Items included: With length adjustment screw. Without pull stud.

Design: Longest tool lives and highest manufacturing quality on usage of smooth cylindrical shanks in accordance with DIN 1835 Form A and DIN 6535 Form HA. With a projection length of  $2.5 \times D$  (max. 50 mm) radial run-out accuracy 3  $\mu\text{m}$ .

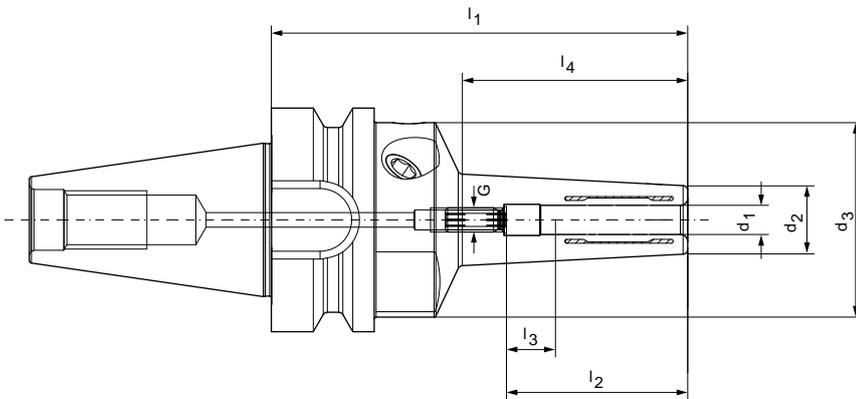

On usage of cylindrical shanks with angled clamping surface (Form E and Form HE) the accuracy may be affected. Normal setting Form JD, if Form JF is required, please state with the order.

Note: Chuck with axial tool length adjustment. Coolant supply via central through bore. Balancing value: G 2.5 at  $25,000 \text{ min}^{-1}$  as delivered.

Dimensions in mm.

Use: For clamping tools with smooth cylindrical shanks in accordance with DIN 6535 Form HA up to clamping diameter  $d_1 = 32$  mm as well as with recesses in accordance with DIN 1835 Form B, E and DIN 6535 Form HB, HE directly and without reducing sleeve in the clamping diameter. The clamping diameter is designed for a tool tolerance of h6. Items included: With length adjustment screw, without coolant tube.

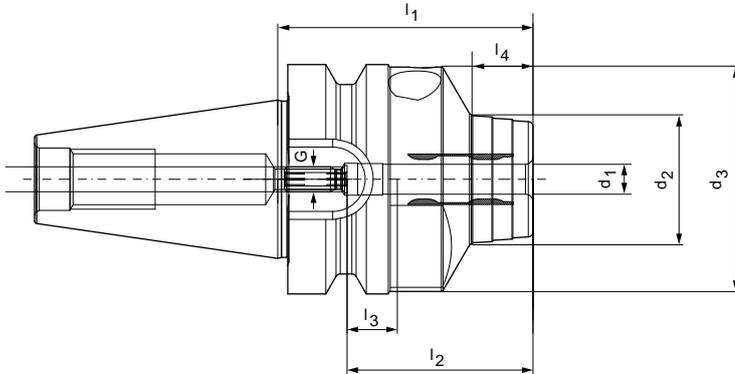

Design: Longest tool lives and highest manufacturing quality on usage of smooth cylindrical shanks in accordance with DIN 1835 Form A and DIN 6535 Form HA. With a projection length of  $2.5 \times D$  (max. 50 mm) radial run-out accuracy  $3 \mu\text{m}$ . On usage of cylindrical shanks with angled clamping surface (Form E and Form HE) the accuracy may be affected.

Note: Chuck with axial tool length adjustment. Coolant supply via central through bore. Balancing value: G 2.5 at  $25,000 \text{ min}^{-1}$  as delivered.

Dimensions in mm.

Items included: Built-in length adjustment screw with through hole.

Without fine balancing screws and coolant tube.

Design: Permissible run-out deviation on the hollow taper shank in relation to the clamping diameter  $d_1 = 3 \mu\text{m}$ . The clamping diameter is designed for a shank tolerance of h6.

Chip version: RFID code carrier on request.

Balancing value: G 2.5 at  $25,000 \text{ min}^{-1}$  as delivered.
